

# QUICK START INSTRUCTIONS

1. Plug unit into a grounded outlet (ozone plates are installed at our factory).
2. Close all outside doors and windows of the area to be treated. Make sure inside doors, such as bathroom and closet doors, are open.
3. **For ozone treatment:**
  - Make sure all people and animals have been removed from the area.
  - Set ozone output and treatment time at desired levels depending on the severity of odors and amount of time available for treatment. Use "Hold" to run continuously for very heavy odors.
  - Upon re-entry to the treated area, make sure timer is in the "Off" position and allow at least one hour after ozone treatment is finished before re-occupying the space.
  - If the space to be treated is very large and has a central heating/cooling system, turn the fan setting to "On" to circulate the ozone while the space is being treated. If not, a fan can be used instead.

## **USE OZONE IN UNOCCUPIED SPACES ONLY**

### **4. For UV Treatment:**

Treatment may be done in occupied spaces and for any length of time. Set the treatment time or turn to the "constant on" position and make sure ozone is in the "off" position. Leave the purifier on until area is treated to your satisfaction and all odors are eliminated. Unit may be run continuously without any negative consequences with ozone off.

**Hold Position:** For more severe odor problems, turn the timer dial to the left to the "Hold" position (In the "Hold" position the unit will stay on indefinitely). Upon return, be sure to turn the timer to the "Off" position and ventilate the area. Do not reoccupy until ozone is at a safe level.
